Looks Like a Bookmark --- Acts Like a Booklight!
'MarkLight' Illuminates the Whole Page with Extra-Wide Beam

Great Gift for Teachers, Students & Book Lovers of All Kinds

NAPA, CA (November 1, 2006) — Most booklights provide a thimbleful of light and have to be repositioned as you move from one area of the page to another. MyLight's new MarkLight™ makes night reading easier with a bendable bookmark shape that has three super-bright LEDs on the upper edge. Slip it between the pages of your book, bend it so that the lighted edge curves over the book like a claw, and you get an extra-wide beam over the entire page. The MarkLight holds its curve while you're reading, and can be flattened and used as a bookmark when you're through.

The secret: a malleable metal strip embedded inside that adapts to any curvature or lack thereof, plus special optics designed to disperse the light in the widest possible pattern. The lighted edge can be raised or lowered to adjust the light distribution, and the light switch offers low and high settings for a one- or three-LED night. The LEDs never need replacement, and the matchbook-sized housing that holds them can be easily removed and snapped back into place when the two lithium 3-volt batteries need to be changed.

The MarkLight also doubles as a laptop keyboard light (place it beneath the computer and bend it toward the screen) and a task light for a table or workbench (bend it into a 'C' shape so that it stands).

The **MyLight MarkLight** is available in black leather, brown faux leather, blue or red woven nylon, and several novelty prints. It measures 1.7" wide, 9" long and 1/16" thick. It sells for \$14.95 in nylon and \$19.95 in leather at www.mylight.com.
